The Hercules Graphics Card (HGC) is a computer graphics controller made by Hercules Computer Technology, Inc. that combines IBM's text-only MDA display standard with a bitmapped graphics mode. This allows the HGC to offer both high-quality text and graphics from a single card. The HGC was very popular, and became a widely supported de facto display standard on IBM PC compatibles.

Video Graphics Array is a video display controller and accompanying de-facto graphics standard, first introduced with the IBM PS/2 line of computers in 1987, which became ubiquitous in the PC industry within three years. The term can now refer either to the computer display standard, the 15-pin D-subminiature VGA connector, or the 640×480 resolution characteristic of the VGA hardware. VGA was the last IBM graphics standard to which the majority of PC clone manufacturers conformed, making it the

Professional Graphics Controller (PGC, often called Professional Graphics Adapter and sometimes Professional Graphics Array) is a graphics card manufactured by IBM for PCs. It consists of three interconnected PCBs, and contains its own processor and memory. The PGC was, at the time of its release, the most advanced graphics card for the IBM XT and aimed for tasks such as CAD.

Professional Graphics Controller - Wikipedia

The standard IBM VGA card has 16 color therefor every pixel needs 4 bits ($2^4 = 16$) The VGA graphical card uses bitplanes, every main color has his own memory area in the video memory. Because the memory address is equal for every main color (A000:0000h memory mapped) we have to program the sequencer to select the right memory bank.

IBM BPM provides built-in visualizations, or dashboards, for the most common process monitoring use cases. The built-in IBM BPM reporting provides summary and detail information on process and worker status. Most of the status information concerns current workload counts and on-time versus past-due status. Figure 2 shows one example.
