Embedded System and Its Real Time Applications

A real-time computer system may be a component of a larger system in which it is embedded; reasonably, such a computer component is called an embedded system. Applications and examples of real-time systems are ubiquitous and proliferating, appearing as part of our commercial, government, military, medical, educational, and cultural infrastructures.

What Are Real-Time Embedded Systems

General-Purpose Operating System (GPOS) is used for desktop PC and laptop while Real-Time Operating System (RTOS) only applied to the embedded application. Real-time systems are used in Airlines reservation system, Air traffic control system, etc. The biggest drawback of RTOS is that the system only concentrates on a few tasks.

Real Time Operating System (RTOS) | Microsoft Azure

Real-time computing (RTC), or reactive computing is the computer science term for hardware and software systems subject to a "real-time constraint", for example from event to system response. [citation needed] Real-time programs must guarantee response within specified time constraints, often referred to as "deadlines". Real-time responses are often understood to be in the order of milliseconds ...
